53 Intake Pressure Relief Valve is designed re between 50 and 250 psi.

The unit is preset at the factory at 125 psi (8.8 bar).

WARNING: The maximum operating pressure is shown in the table above.

WARNING: The outlet must be vented through the discharge in order for the relief valve to operate properly.

WARNING: Ensure the relief valve discharge is directed away from personnel. A high water discharge flow has the potential to cause injury.

CAUTION: The Akron Brass Pressure Relief Valve has been developed for firefighting use mounted to a fire pump intake.

Do not alter or attempt to use in other applications.

The relief valve, which is factory set at 125 psi, can be adjusted using a 7/8" socket or wrench.
Rotating the adjustment nut (4) clockwise will increase the pressure at which the valve will open and rotating counterclockwise will decrease the pressure.

3. The relief value is set by aligning the highlighted surface on the adjustment nut to the height of the desired setting labeled on the relief housing.

4. The relief valve should not be tightened past the 250 psi setting; doing so may cause damage to the valve. 5. Flow water through the pressure relief valve to verify the valve relief pressure.
